

```
struct student {
```

06-02-2019

```
    int roll_no; ←
```

```
    string name; ←
```

```
};
```

```
int main() {
```

```
    → student s1; ← student value
```

```
    → s1.name = "Ali";
```

→ name = "Ali" X

*int x;  
int \*p;  
p = &x;*

```
    → student *s;
```

```
    → s = &s1; // one way of getting the address ...
```

```
    → cout << (*s).name; // Ali
```

```
    cout << s->name;
```

$s \rightarrow \equiv (*s)$

```
// new instance
```

```
    → s = new student; ← returns an address
```

```
    → s->name = "Usman";
```

*(\*s).name*

```
// delete an existing instance  
// opposite of new
```

```
    → delete s;
```

## Pointers Case Study

Recall Python's Lists: `[1, 2, 3, 14, 16, 19]`

Important properties: (a) heterogeneity  $\leftarrow$  structs  
(b) variable length  $\leftarrow$

Strategy: `int a[1000000];`

`a[] = {1, 2, 3};` `int a[];`

`[1, 2, 3]`

struct node {  
    → int val;  
    → node \* next;  
};

→ node \*n;

→ n = NULL;

node → n = new node;  
                    ↑  
                    address of a node

$\rightarrow n \rightarrow \text{val} = 1;$   
 $\rightarrow n \rightarrow \text{next} = \text{NULL};$

$n \rightarrow \text{next} = \text{new node};$   
 address of a node

$n \rightarrow \text{next} = \text{address}^{1058};$

$\text{cout} \ll n \rightarrow \text{next};$

$n \rightarrow \text{next} \rightarrow \text{val} = 5;$   
 $(1058 \rightarrow \text{val} = 5;)$

$n \rightarrow \text{next} \rightarrow \text{next} = \text{NULL};$

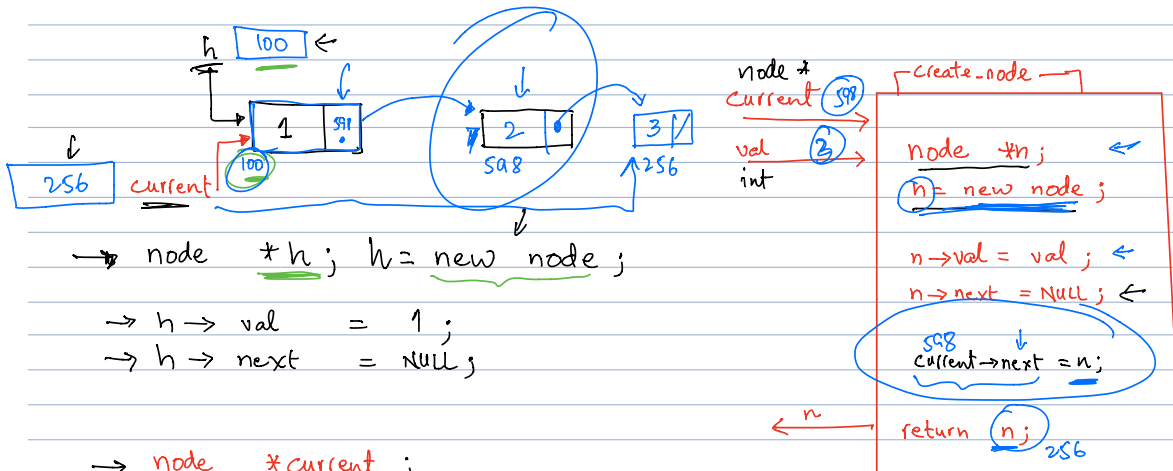

$\text{node } *n;$   $\text{node } *current;$

$n = \text{new node};$   
 $n \rightarrow \text{val} = 1;$   
 $n \rightarrow \text{next} = \text{NULL};$

$current = \text{new node};$   
 $n \rightarrow \text{next} = current;$   
 $current \rightarrow \text{val} = 5;$   
 $current \rightarrow \text{next} = \text{NULL};$

current = create\_node(current, 2);

current = create\_node(current, 3);

for (int i = 0; i < 10; i++) {

current = create\_node(current, i);

}

Show the list:

```

while (current != NULL) {
    cout << current → val << endl;
    current = current → next;
}
  
```

current = h;

1  
2  
3  
4

Delete from a list:

node \*temp;      temp = current → next;  
 current → next =      current → next → next;

delete temp;

temp = NULL;
