

COLLECTING RELATED DATA

```
int x;  
x = 25;
```

Same data type for all elements

Arrays

- Homogeneous
- Contiguous

Annotation: *"a[0]"* (with arrow pointing to `a[0]` in the code below)

Annotation: *dataType* (with arrow pointing to `int` in the code below)

Annotation: *name* (with arrow pointing to `a` in the code below)

Annotation: *size / # of elements* (with arrow pointing to `[3]` in the code below)

```
int a[3];  
a[0] = 25;  
for (int i = 2; i >= 0; i--) {  
    cout << a[i] << endl;  
}
```

→ `i` ⇒ error

`a[0][2] = 27;`

2-D Arrays:

```
int a[2][3];
```

```
for (int i = 0; i < 2; i++) {
```

```

i 0
j 1
for ( int j=0; j<3; j++) { → columns
    a[i][j] = i * j; ← // cout << a[i][j];
}

```

Character Arrays: string

```

char a[] = "Hello";

```

a

H	e	l	l	o	\0
0	1	2	3	4	5

↑ null terminator

```

for (int i=0; i<6; i++) {
    cout << a[i] << endl;
}

```

≡ { cout << a ;

↓

H
e
l
l
o
.
_

Hello

```

#include <iostream>

```

```

#include <string>

```

```

using namespace std;

```

→ Homogeneous

```

int main() {
    char a[];
    ← string a = "Hello";
    a[0] → H
}

```

Structs:

"A student has a name and a roll number."

Objective: create a structure to store student information.

#include

```
struct student {  
    string name;  
    int roll_no;  
};
```

S1

name:	"Ali"
roll_no:	25

```
int main() {  
    Student S1;
```

(S1) name = "Ali";
↳ "enter the box"

S1.roll_no = 25;

```
    cout << S1.name;  
}
```

~~int x[5];~~
X type X
name size / # of elements.

student S[5];
type name # elements.

S[0].name = "Ali";
student S[0] ← assign string.
enter

S[0].roll_no = 25;

S[0]
S[1]
S[2]
S[3]
S[4]
S[5]

name:	Ali
roll_no:	25
